Introduction

Protocol frame structure

| Hea | ader | Ra | ange over w | Checksum | | | | |
|-------|-------|----------|-------------|----------|--------|--------------|-------|-------|
| SYNC1 | SYNC2 | ROUTE | MODE | CHECK1 | CHECK2 | | | |
| U1 | U1 | U1 | U1 | U1 | U1 | BYTE[LENGTH] | U1 | U1 |
| 0xBB | 0x55 | BITFIELD | BITFIELD | 1 255 | 0 128 | BYTEARRAY | 0 255 | 0 255 |

| ROUTE | | | | | | |
|-------------|---------|---|--|--|--|--|
| Name | Bits | Description | | | | |
| DEV_ADDRESS | 0:3 bit | Device address. Default and broadcast address is 0x0. | | | | |
| RESERVED | 3:7 bit | Reserved | | | | |

| | MODE | | | | | |
|----------|---------|---|--|--|--|--|
| Name | Bits | Description | | | | |
| TYPE | 0:1 bit | Field defines the type and purpose of the data 0 — Reserved, 1 — CONTENT: DEVICE → HOST 2 — SETTING: HOST → DEVICE 3 —GETTING: HOST → DEVICE | | | | |
| RESERVED | 2 bit | Reserved | | | | |
| VERSION | 3:5 bit | Field defines the payload data version | | | | |
| MARK | 6 bit | Once device is switched on, this flag is always in reset state (ZERO). It can be set to active state (ONE) by the host (see the ID_MARK) and the slave device keeps the flag in active state in every frame until hardware reset occurs or is reset by the host. Therefore the host monitors the device's actual settings. | | | | |
| RESPONSE | 7 bit | HOST → DEVICE: Set the flag to active state (ONE) in order to get the result of processing the command. The flag doesn't affect the response if one is provided by the TYPE field. DEVICE → HOST: The flag is in reset state (ZERO) by default. Payload goes according to the command specification. If flag is set, the payload contains the result of command processing (see RESP). | | | | |

Checksum

The checksum algorithm used is the Fletcher-16.

Example source code for calculating the checksum:

```
uint8_t CHECK1 = 0;
uint8_t CHECK2 = 0;
void CheckSumUpdate(uint8_t byte) {
      CHECK1 += byte;
      CHECK2 += CHECK1;
}
```

Number Formats

All multi-byte values are ordered in Little Endian format.

All floating point values are transmitted in IEEE754 single or double precision.

All bit-field in LSB format.

| Name | Туре | Size (Bytes) | Range |
|------|----------|--------------|------------------------------|
| S1 | int8_t | 1 | -128 127 |
| U1 | uint8_t | 1 | 0 255 |
| S2 | int16_t | 2 | -32768 32767 |
| U2 | uint16_t | 2 | 0 65535 |
| S4 | int32_t | 4 | -2'147'483'648 2'147'483'647 |
| U4 | uint32_t | 4 | 0 4'294'967'295 |
| F4 | float | 4 | -1*2^+127 2^+127 |
| D8 | double | 8 | -1*2^+1023 2^+1023 |

Confirmation key

KEY_CONFIRM = 0xC96B5D4A

Command specification

Command overview

| Name | ID | Description | | | |
|----------------|------|---|--|--|--|
| | | | | | |
| ID TUATOTANA | 0.01 | Measurement data | | | |
| ID_TIMESTAMP | 0x01 | Timestamp | | | |
| ID_DIST | 0x02 | Distance data | | | |
| ID_CHART | 0x03 | Chart data in reflection patterns | | | |
| ID_ATTITUDE | 0x04 | Attitude | | | |
| ID_TEMP | 0x05 | Temperature data | | | |
| | | Settings data | | | |
| ID_DATASET | 0x10 | Dataset management for automatic output | | | |
| ID_DIST_SETUP | 0x11 | Detection Settings to Get Distance | | | |
| ID_CHART_SETUP | 0x12 | Chart Settings | | | |
| ID_DSP | 0x13 | | | | |
| ID_TRANSC | 0x14 | Transceiver settings | | | |
| ID_SOUND | 0x15 | Sound speed settings | | | |
| ID_PIN | 0x16 | Pin functions settings | | | |
| ID_BUS | 0x17 | Bus settings | | | |
| ID_UART | 0x18 | UART settings | | | |
| ID_I2C | 0x19 | I2C settings | | | |
| ID_CAN | 0x1A | CAN settings | | | |
| ID_IMU_SETUP* | 0x1B | IMU settings | | | |
| | | System | | | |
| ID_VERSION* | 0x20 | Software and hardware version information | | | |
| ID_MARK | 0x21 | Setting the mark of continuous work (non-reboot) device | | | |
| ID_DIAG* | 0x22 | Diagnostic data | | | |
| ID_FLASH | 0x23 | Work with built-in non-volatile memory | | | |
| ID_BOOT | 0x24 | Boot device | | | |
| ID_UPATE | 0x25 | Firmware update | | | |
| | I | • | | | |

| | | Navigation |
|--------|------|------------|
| ID_NAV | 0x64 | |

^{*} In developing

RESP

Contains the result of command processing. Can be used as a check if the command is processed correctly. The MODE and ID fields are the same as in the initiating command.

| | Format [U2, U2, U1[N]]; Length (6 + N) | | | | | | | | |
| | | Туре | Range | Default | Unit | Description | | | |
| SEQ_OFFSE | T | U2 | 0 | | | Sample Offset in Sequence | | | |
| SAMPEL_R | ES0L | U2 | 10 | | mm | Samples resolution | | | |
| ABS_OFFSET | | U2 | 0 | | | Absolute Offset in sample number for Sequence | | | |
| CHART | | U1[N] | ARRAY | | | Data of chart. The maximum data length in one packet is 250. | | | |

| | Chart data | | | | | | | |
|-----------------|------------|------|-------------|---------------------------|--------------------------------|-------------|--|--|
| TYPE | Version | | Direction | Description | | | | |
| CONTENT | 1 | DE\ | /ICE → HOST | Data of ch | Data of chart in sample format | | | |
| | | | Format [U2, | U2, U2, U1[| N]]; Length | (6 + N) | | |
| | | Type | Range | Default | Unit | Description | | |
| SEQ_OFFSET U2 0 | | | | Sample Offset in Sequence | | | | |
| SAMPEL_RESOL U2 | | 10 | | mm | Samples resolution | | | |

| ABS_OFFSET | U2 | 0 | Absolute Offset in sample number for Sequence |
|------------|-------|-------|---|
| CHART | U1[N] | ARRAY | Data of two charts. The two channels are represented by interleaved data. For example, the first byte is the first measurement of the first channel and the second is the first measurement of the second channel. The maximum data length in one packet is 250. Accordingly, the maximum channel length is 125. |

ID_ATTITUDE (0x04)
